Toeplitz Approximation

Adam Rahman

February 8, 2019

Given a symmetric matrix **F**, the Toeplitz approximation problem seeks to find the nearest symmetric positive definite Toeplitz matrix. In general, a Toeplitz matrix is one with constant descending diagonals, i.e.

$$\mathbf{T} = \left[egin{array}{ccccc} a & b & c & d & e \ f & a & b & c & d \ g & f & a & b & c \ h & g & f & a & b \ i & h & g & f & a \end{array}
ight]$$

is a general Toeplitz matrix. For our specific problem, we seek a symmetric Toeplitz matrix, i.e.,

$$\mathbf{T}^* = \begin{bmatrix} a & b & c & d & e \\ b & a & b & c & d \\ c & b & a & b & c \\ d & c & b & a & b \\ e & d & f & b & a \end{bmatrix}$$

The problem is formulated as the following optimization problem

maximize
$$-y_{n+1}$$
 subject to
$$\begin{bmatrix} \mathbf{I} & \mathbf{0} \\ \mathbf{0} & -\beta \end{bmatrix} + \sum_{k=1}^{n} y_k \begin{bmatrix} \mathbf{0} & \gamma_k \mathbf{e}_k \\ \gamma_k \mathbf{e}_k^T & -2q_k \end{bmatrix} + y_{n+1} \mathbf{B} \geq \mathbf{0}$$

$$[y_1, ..., y_n]^\mathsf{T} + y_{n+1} \mathbf{B} \geq \mathbf{0}$$

$$+ 1) \times (n+1) \text{ matrix of zeros} \text{ and } \mathbf{B}_{k+1} \times \dots = 1, a_1 = -tr(\mathbf{F}), a_2 = \text{sum of } \mathbf{e}_k$$

where **B** is an $(n+1) \times (n+1)$ matrix of zeros, and $\mathbf{B}_{(n+1)(n+1)} = 1$, $q_1 = -tr(\mathbf{F})$, $q_k = \text{sum of } k^{th}$ diagonal upper and lower triangular matrix, $\gamma_1 = \sqrt{n}$, $\gamma_k = \sqrt{2 * (n-k+1)}$, k = 2, ..., n, and $\beta = ||\mathbf{F}||_F^2$.

The function toep takes as input a symmetric matrix F for which we would like to find the nearest Toeplitz matrix, and returns the optimal solution using sqlp.

R> out <- toep(F)

Numerical Example

Consider the following symmetric matrix for which we would like to find the nearest Toeplitz matrix

R> data(Ftoep)

```

Using sqlp, we are interested in the output Z, the optimal solution to the dual problem, which will be the nearest symmetric Toeplitz matrix. Note that the final row/column should be removed.

0.098 0.563

```
R> out <- toep(Ftoep)
R> F <- out$Z[[1]]
R > F \leftarrow F[-nrow(F),]
R> F <- F[,-ncol(F)]</pre>
